INTRODUCTION

1.1 Overview

This project is used to analyze rainfall based on several fields of data which are collected by various methods, these data are well analyzed by the model created in python and the result derived from it. By utilizing the results generated one can improve their Agricultural Field.

1.2 Purpose

The main purpose of the project is to predict whether there will be heavy rainfall tomorrow so that the farmer may take precautionary measures to safe guard his crop fields.

2.LITERATURE SURVEY

2.1 Existing problem

Some of the existing solutions for solving this problem are:

1.How can I predict rainfall using machine learning techniques?

For rainfall/precipitation or for any kind of numerical weather prediction you can use any classification problem algorithm such as XGBoost , Logistic Regression or any other relevant technique based upon binary classification problems (Those resulting in a binary output).

2.What are the objectives of rainfall prediction?

Rainfall Prediction Model has a main objective in prediction of the amount of rain in a specific well or division in advance by using various regression technique and find out which one is best for rainfall prediction. This model also helps the farmer for agriculture to decide the crop, helping the watershed department for water storage and also helps to analyze the ground water level.

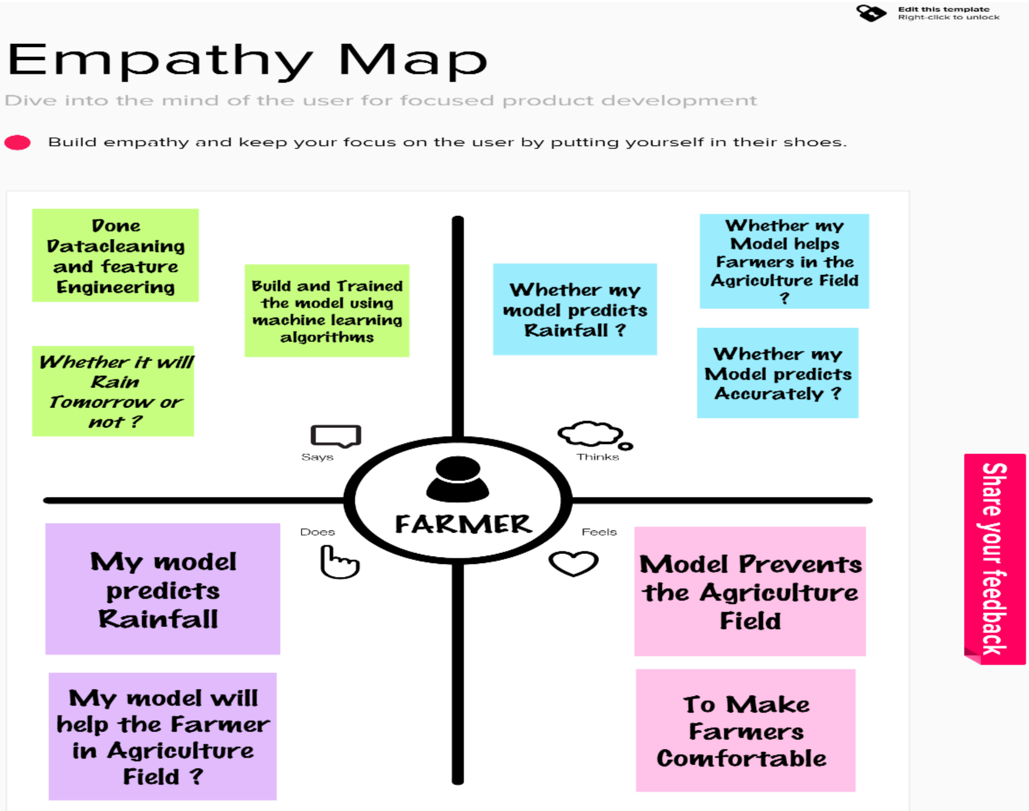
2.3 Problem Statement Definition

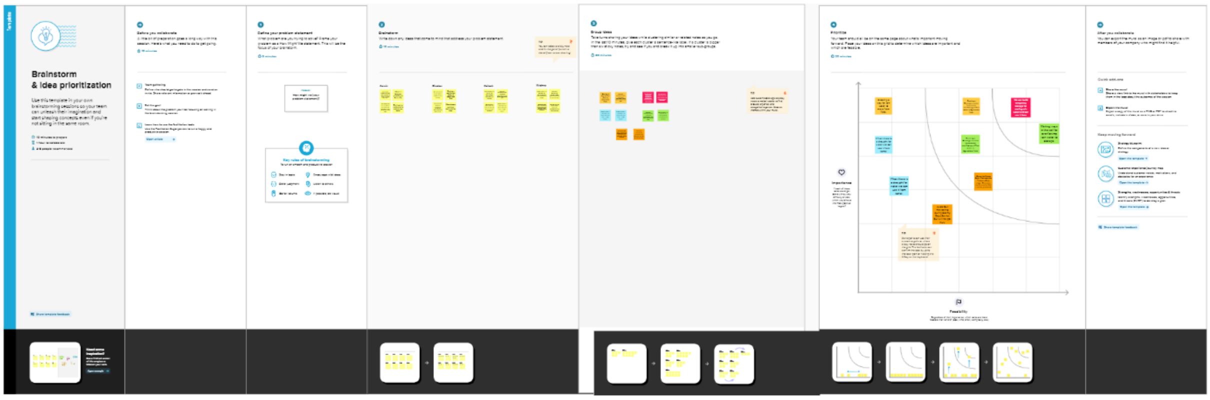
This paper introduces current supervised learning models which are based on machine learning algorithm for Rainfall prediction in India. Rainfall is always a major issue across the world as it affects all the major factor on which the human being is depended. In current, Unpredictable and accurate rainfall prediction is a challenging task. We apply rainfall data of India to different machine learning algorithms and compare the accuracy of classifiers such as XGBOOST , Logistic Regression.

3.IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas



3.2 Ideation & Brainstorming



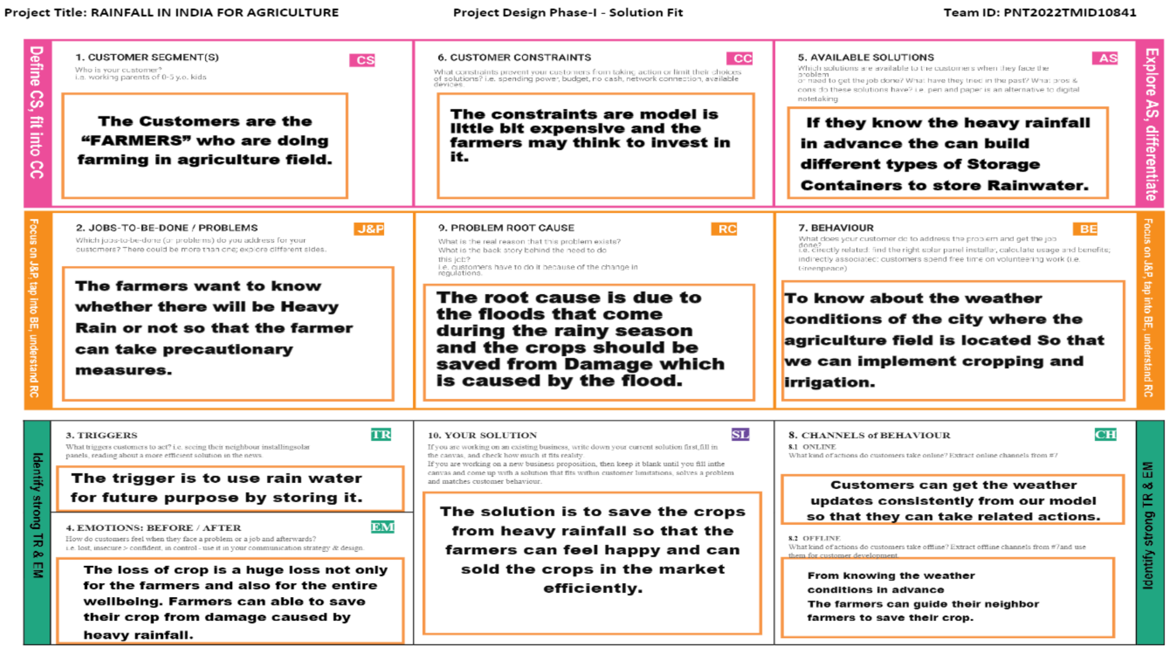
3.3 Proposed Solution

S. No.	Parameter	Description

1.	Problem Statement (Problem to be solved)	The Farmer wants to Know whether there is a Rainfall Tomorrow or not so that His Agricultural Field can be maintained properly. The Farmer wants to Harvest/Save the water so that it can be used for Future Purpose. The Farmer wants to Know There will be a Heavy Rainfall so that the Precautionary Measures can be tken.
2.	Idea / Solution description	1 .Pesticides should be used after the rain in order to avoid wastage. 2 .When It is Sunny the probability of Rain is low. 3. Drip Irrigation can be used in order to save water. 4 .Setting up the soil to equally distribute the rain water to all the plants in the field. 5. Creating a way for rain water to move from field. 6.We can avoid using motor pumps while raining. 7. We can build temporary storage for storing rain water and can use it later. 8. When storm is predicted don't yield the crop. 9.Making ways in the soil for overflowing rain water to storage. 10.Creating a Drainage in order to preserve overflowing of Rain water in Agriculture field.

3.	Novelty / Uniqueness	Applied appropriate machine learning algorithms to get the best results. 2. Forecasted rainfall with Time Series.
4.	Social Impact / Customer Satisfaction	1 . Farmers will be satisfied to save the rain water. 2 . It will be useful to avoid flood in Agriculture field in order to take precautionary measures.
5.	Business Model (Revenue Model)	Since we predicted the rainfall in advance so we may able to avoid the loss of cost for the Farmers. Using this idea, we can make a stable business and get a profitable revenue.
6.	Scalability of the Solution	Our project has better scalability since our model analysis all information provides better refined solution. With the help of this Prediction it will be easy for the farmers to cultivate in the agricultural field.

3.4 Problem Solution fit



4.REQUIREMENT ANALYSIS

4.1Functional requirement

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail Registration through LinkedIN
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	Reset Password	Reset password through Gmail Reset password through Mobile number
FR-4	Feedback	The user can submit the feedback through a contact form in the website or through Gmail.

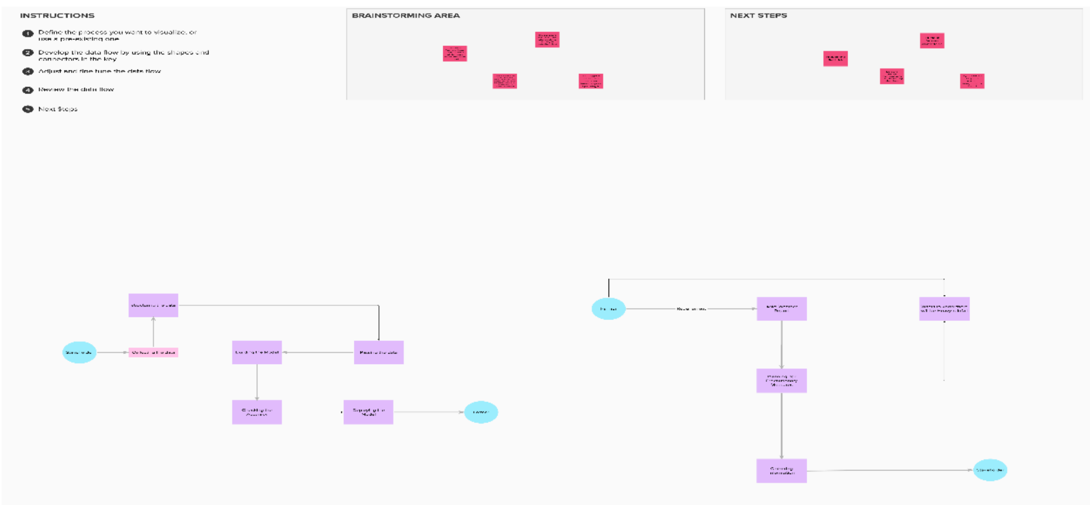
4.2 Non-Functional requirements

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	The Analyser allows the user to know whether there will be a heavy rainfall or not using the data provided.
NFR-2	**Security**	By knowing the rain in advance we can secure the humans and animals by turning off the electrical fences.
NFR-3	**Reliability**	The reliability rating is good due to best performance, less frequency of problem occurrence and cost for repairing is low.
NFR-4	**Performance**	The model is built in an optimised manner and the model will be more accurate on predictions.
NFR-5	**Availability**	Weather Data of various cities in India is collected from the Google weather Database.
NFR-6	**Scalability**	Since we use various machine learning algorithms for predicting the chance of rainfall, we use performance metrics like accuracy, AUC, Precision, Recall, etc , to measure the performance of our model.

5.PROJECT DESIGN

5.1 Data Flow Diagrams



5.2 Solution & Technical Architecture:

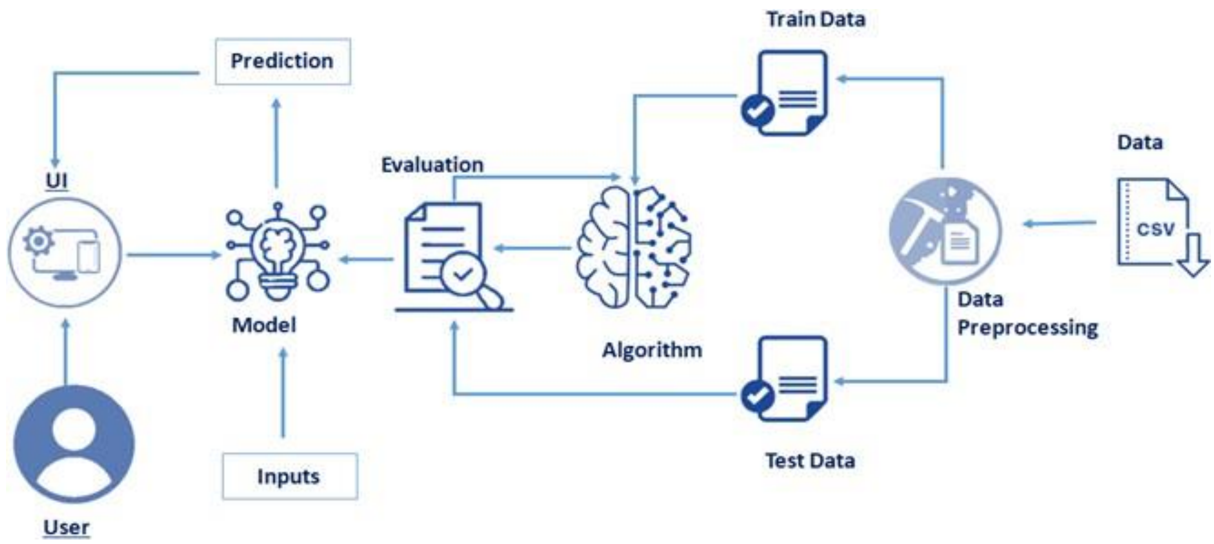


Table-5.2.1: Components & Technologies:

S. No	Component	Description	Technology
1.	User Interface	With the help of web UI, user has better experience And can access the website user-friendly.	HTML, CSS, JavaScript, React JS.
2.	Application Logic-1	Customer can login with username and password.	Java / Python
3.	Application Logic-2	Farmer can give their feedback about weatherconditions.	IBM Watson STT service
4.	Application Logic-3	Farmer can check whether there will be heavy rainfall tomorrow or not and can able to take Precautionary measures.	IBM Watson Assistant
5.	Database	Data Type, Configurations etc.	MySQL.
6.	Cloud Database	Database Service on Cloud	IBM DB2, IBM Cloudant etc.
7.	File Storage	File storage requirements	IBM Block Storage or Other Storage Service or Local Filesystem
8.	External API-1	Purpose of External API used in the application	Aadhar API
9.	External API-2	Purpose of External API used in the application	Aadhar API
10	Machine Learning Model	To create model for analysis	1. Logistic Regression 2. Decision Tree Classifier

			3. Random Forest Classifier 4.KNN 5. SVM xgboost
11	Infrastructure (Server / Cloud)	Application Deployment on Local System / CloudLocal Server Configuration: Cloud Server Configuration :	Local, Cloud Foundry, Kubernetes, etc.

Table-5.2.2: Application Characteristics:

S. No	Characteristics	Description	Technology
1.	Open-Source Frameworks	List the open-source frameworks used REACT JS EXPRESS JS NODE JS	Technology of Opensource frameworkJAVASCRIPT and PYTHON
2.	Security Implementations	List all the security / access controls implemented, use of firewalls etc.	e.g. SHA-256, Encryptions, IAM Controls, OWASP etc.
3.	Scalable Architecture	Justify the scalability of architecture (3 – tier, Micro-services) This improves scalability, because application servers can be deployed on many machines. The database does not make longer connections with every client – it only requires connections from a smaller number ofapplication servers	Presentation Layer – React JS (HTML, CSS ,JS) Application Layer – Flask (Python) Data Layer – IBM DB2
4.	Availability	Justify the availability of application (e.g. use of load balancers, distributed servers etc.)	Technology used
5.	Performance	Design consideration for the performance of the application (number of requests per sec, use of Cache, use of CDN's) etc.	Technology used

5.3 User Stories:

User Type	Functional Requirements	User Story Number	User Story/Task	Acceptance Criteria	Priority	Release
Farmer	Registration	USN -1	As a Farmer, I can register for the Model service by entering my email, password, and confirming my password	I can access my account / dashboard	High	Sprint-1

Farmer	Registration	USN - 2	As a Farmer, I will receive confirmation email once I have registered for the service	I can receive confirmation email & click confirm	High	Sprint-2
Farmer	Accuracy to check the performance and health of the car	USN -3	After checking , the model build by the Admin will be sent to the Farmer.	The rainfall data can be predicted predicted.	High	Sprint-3

6.PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Required Data	USN-1	Model Building	2	High	Aswin N S Divakar U
Sprint-2		USN-2	Application Building	1	High	Aswin N S Divakar U
Sprint-3		USN-3	Train the model on IBM	2	Low	Aswin N S Divakar U Krishna R
Sprint-4		USN-4	Integrate flask with scoring end-point	2	Medium	Aswin N S Kailash N

6.2 **Estimation:**

Pre-Requisites	M-01	The following software concepts and packages, including Machine learning, Python, KNN, Python Flask, IBM Cloudland DB, and Watson Studio, should have been familiar to us by the time we finished this project.	Yes
Data Collection	M-02	To create a project structure, create a Dataset.	Yes
Data Preprocess ing	M-03	The dataset collection is separated into a various collection, first reading the dataset, handling the missing values, label encoding and one hot coding, splitting the dataset into dependent and independent variable, and into trainset and test set and normalizing and finally importing libraries.	Yes
Model Building	M-04	Build the model with the random forest regressor, predict the values and model the evaluation	Yes
Application Building	M-05	First, build an Index, HTML file, python code and python code-II, Run the app and finally output.	Yes
Train the model on IBM	M-06	Register on cloud IBM, train the model on IBM and integrate with the flask with scoring end point.	Yes

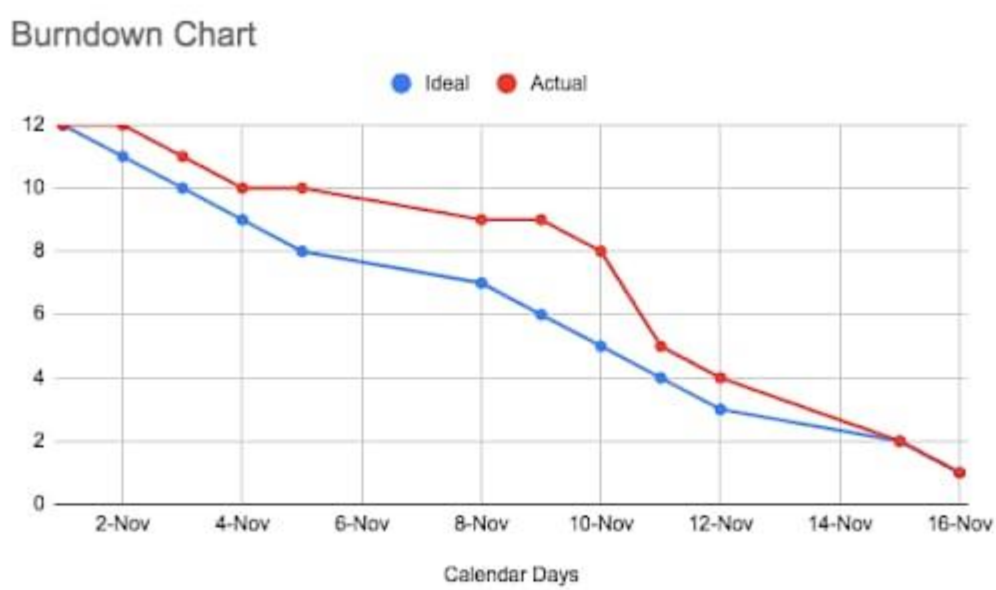
Ideation Phase	M-07	Prepare empathy map, take literature survey and Ideation.	Yes
Project Design Phase-I	M-08	Proposed Solution, Problem solution fit, Solution architecture.	Yes
Project Design Phase-II	M-09	Preparation of the technological stack architecture, functional requirements, data flow diagrams, and customerjourney mapping.	Yes
Project Planning Phase	M-10	Prepare Milestone & Activity List and Sprint Delivery Plan.	Yes
Project developme nt phase	M-11	Develop Sprint 1, Sprint 2, Sprint 3, Sprint 4.	Yes

6.2 Sprint Delivery Schedule:

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 ov 2022	20	19 Nov 2022

6.3 Reports from JIRA:

Burndown Chart: A burndown chart is a graphical representation of work left to do versus time. It is often used in agile software development methodologies such as Scrum. However, burn down charts can be applied to any project containing measurable progress over time.

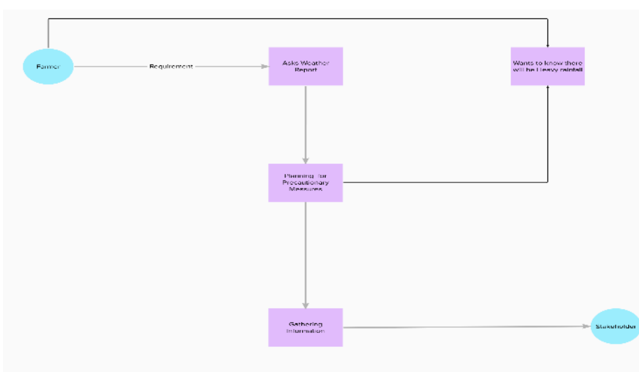


7.CODING & SOLUTIONING:

7.1 Features:

FR No.	Feature	Description
FR-1	Enter the input	Get input through the form
FR-2	User Essential	Predict the whether there will be rainfall tomorrow
FR-3	Data preprocessing	Sample dataset for training purpose
FR-4	User input Evaluation	Evaluating the given user values
FR-5	Prediction	Predict the whether there will be rainfall tomorrow

7.2DFD:



8.RESULTS:

			`F1 score for XGBoost is : 62.34324614833393 %`

2.	Accuracy	Logistic regression Accuracy-84.55 F1 Score -58.57	Logistic Regression

			Model Training In [101]: #Logistic Regression model = LogisticRegression(max_iter=500) model.fit(X_train, y_train) predicted=model.predict(X_test) conf = confusion_matrix(y_test, predicted) print ("The accuracy of Logistic Regression i print() print("F1 score for logistic regression is :" The accuracy of Logistic Regression is : 84. F1 score for logistic regression is : 58.573

8.2 PROS AND CONS:

PROS:

- XGB consists of a number of hyper-parameters that can be tuned — a primary advantage over gradient boosting machines.
- XGBoost has an in-built capability to handle missing values.
- It provides various intuitive features, such as parallelisation, distributed computing, cache optimisation, and more.

CONS:

- XGBoost does not perform so well on sparse and unstructured data.
- A common thing often forgotten is that Gradient Boosting is very sensitive to outliers since every classifier is forced to fix the errors in the predecessor learners.
- The overall method is hardly scalable.

9. CONCLUSION:

Rainfall forecasting has gained utmost research relevance in recent times due to its complexities and persistent applications such as flood forecasting and monitoring of pollutant concentration levels, among others. Existing models use complex statistical models that are often too costly, both computationally and budgetary, or are not applied to downstream applications. Therefore, approaches that use Machine Learning algorithms in conjunction with time-series data are being explored as an alternative to overcome these drawbacks. To this end, this study presents a comparative analysis using simplified rainfall estimation models based on conventional Machine Learning algorithms XGBoost Classifier , Logistic Regression were compared in the task of forecasting hourly rainfall volumes using time-series data. Climate data from 2000 to 2022 from five major cities in the United Kingdom were used. The evaluation metrics of Accuracy were used to evaluate the models' performance.

10.FUTURE WORKS:

Rainfall Prediction Model has a main objective in prediction of the amount of rain in a specific well or division in advance by using various regression technique and find out which one is best for rainfall prediction. Weather warnings are important forecasts because they are used to protect life and property. Forecasts based on temperature and precipitation are important to agriculture, and therefore to traders within commodity markets. Temperature forecasts are used by utility companies to estimate demand over coming days. So we Build this model using xgboost and logistic Algorithms , so that it will be useful in the future.

11.APPENDIX:

Source code:

This dataset contains about 10 years of daily weather observations from many locations across India.

The prediction is all about Tomorrow it going to rain or not based on all factors like temperature,humidity,pressure etc. Target_variable:Rain_tomorrow.

RainTomorrow     3267
dtype: int64
```

OnehotEncoding handles categorical features null values very cleverly so we will use get_dummies function from pandas to handle null values and convert the data into proper format to use machine learning model.

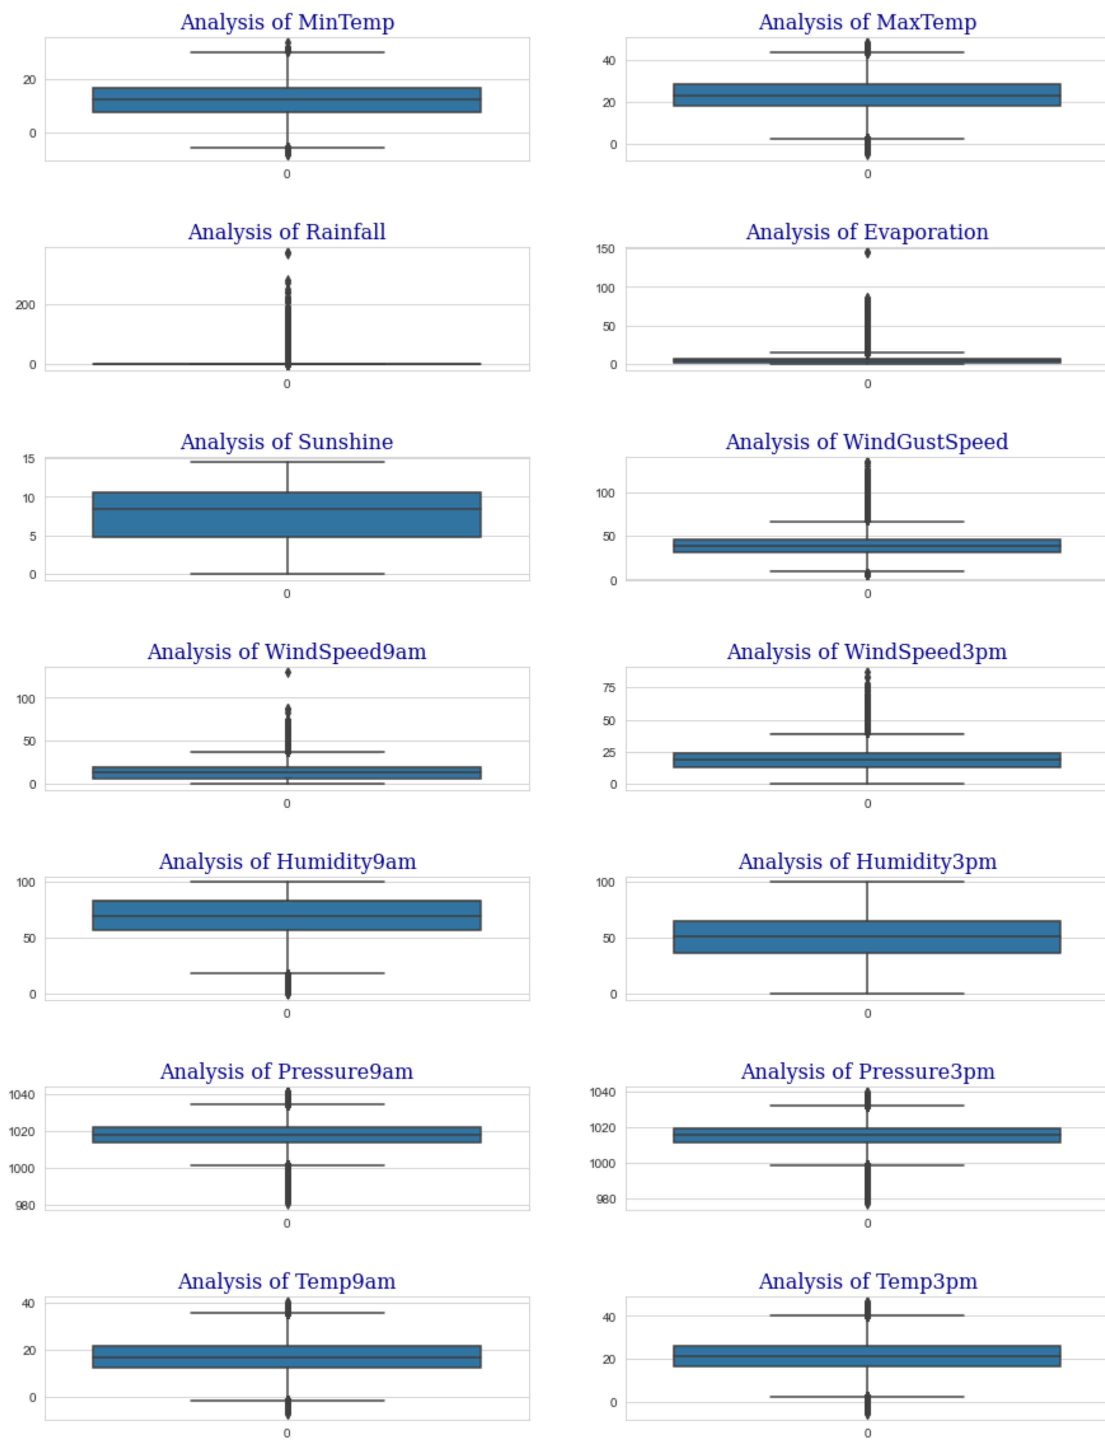
```
# sns.pairplot( data=df, vars=('MaxTemp','MinTemp','Pressure9am','Pressure3pm',
'Temp9am', 'Temp3pm', 'Evaporation'), hue='RainTomorrow' )
# plt.show()

def plot_boxplot(df, continuous_features):
    # create copy of dataframe
    data = df[continuous_features].copy()
    # Create subplots
    fig, axes = plt.subplots(nrows=len(data.columns)//2, ncols=2,figsize=(15,20))
    fig.subplots_adjust(hspace=0.7)

    # set fontdict
    font = {'family': 'serif',
        'color':  'darkblue',
        'weight': 'normal',
        'size': 16,
        }

    # Generate distplot
    for ax, feature in zip(axes.flatten(), data.columns):
        sns.boxplot(data[feature],ax=ax)
        ax.set_title(f'Analysis of {feature}', fontdict=font)
    plt.show()

plot_boxplot(df, continuous_features)
```



```
outliers_features = [feature for feature in continuous_features if feature not in
['Sunshine','Humidity3pm']]
print(outliers_features)
```

```
['MinTemp', 'MaxTemp', 'Rainfall', 'Evaporation', 'WindGustSpeed', 'WindSpeed9am',
'WindSpeed3pm', 'Humidity9am', 'Pressure9am', 'Pressure3pm', 'Temp9am', 'Temp3pm']
```

```
def remove_outliers(df,outliers_features):
    # create copy of dataframe

    data = df.copy()

    for feature in data[outliers_features].columns:
```

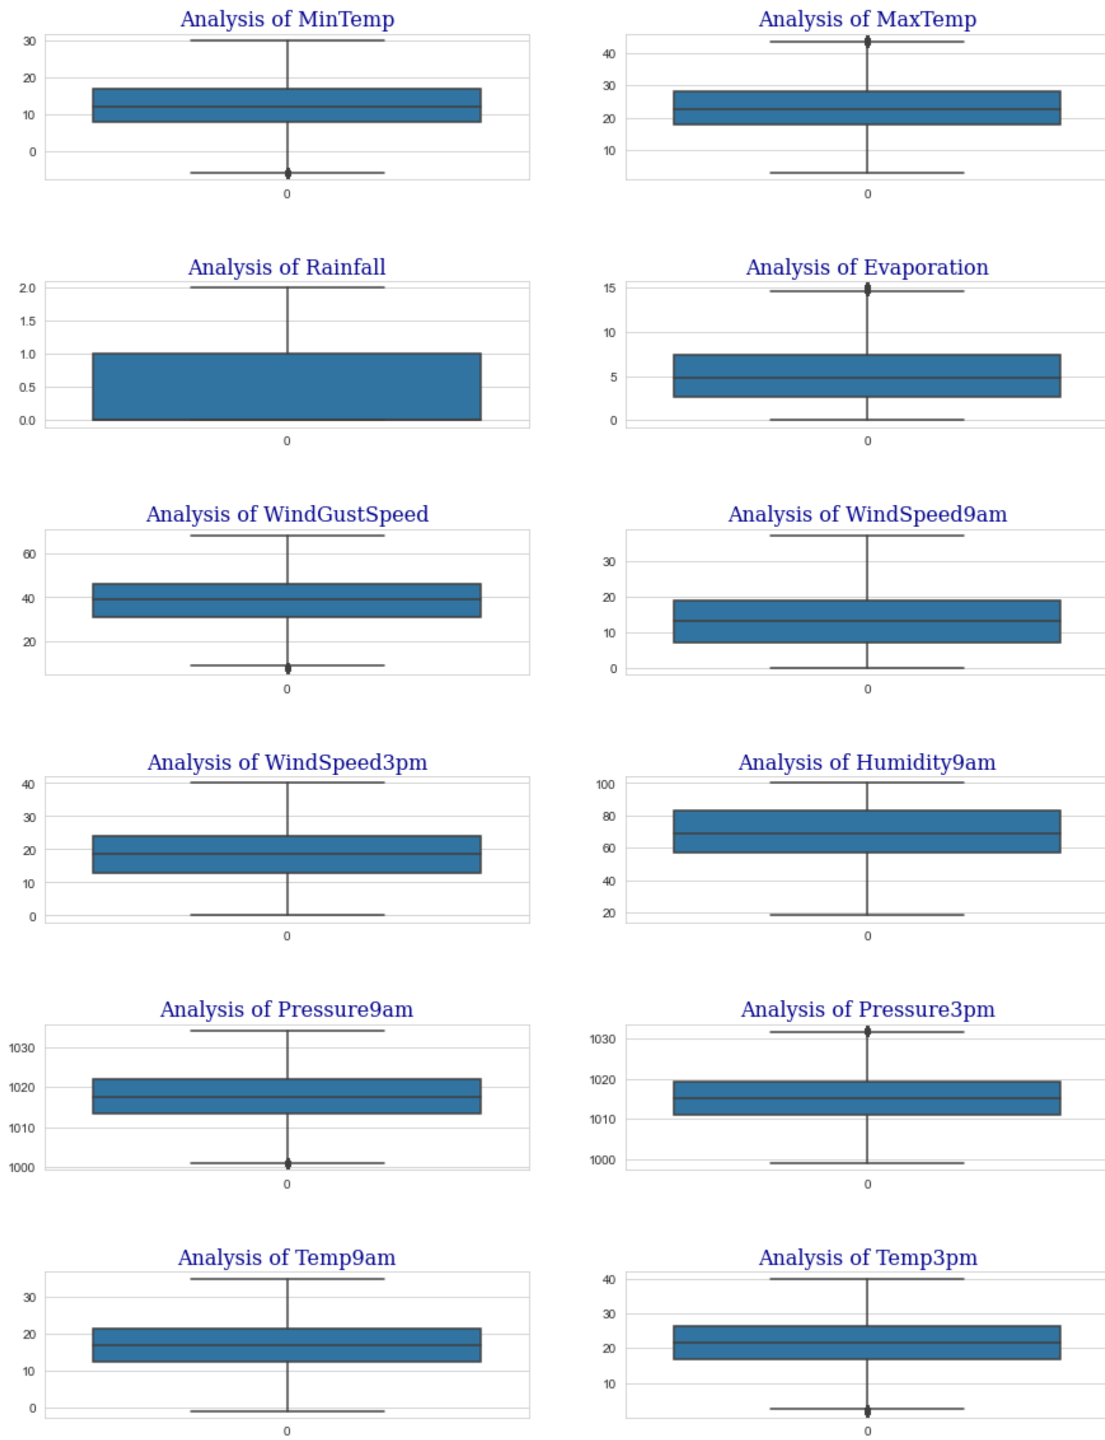
```
        Q3 = data[feature].quantile(0.75)
        Q1 = data[feature].quantile(0.25)
        IQR = Q3 - Q1
        lower_limit = round(Q1 - 1.5 * IQR)
        upper_limit = round(Q3 + 1.5 * IQR)
        data.loc[data[feature]>= upper_limit,feature] = upper_limit
        data.loc[data[feature]<=lower_limit,feature] = lower_limit
#         data = data[(data[feature] < upper_limit) & (data[feature] > lower_limit)]
    return data
```

```
df = remove_outliers(df,outliers_features)
```

```
df.shape
```

```
(145460, 23)
```

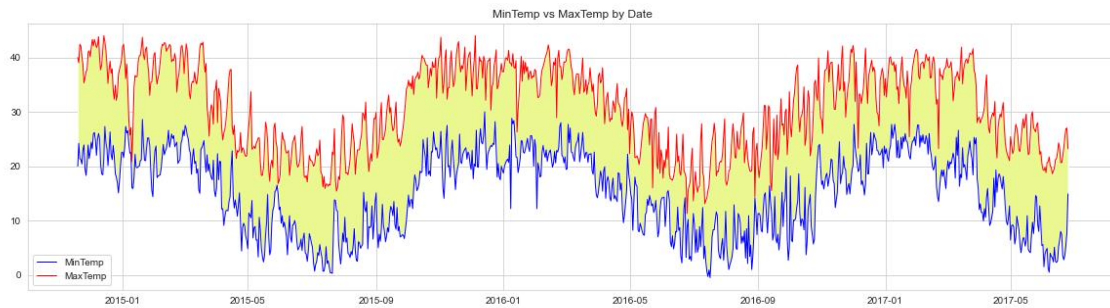
```
plot_boxplot(df, outliers_features)
```



```
# Raintoday
df['RainToday'] = df['RainToday'].fillna('No')
# Raintomorrow
df['RainTomorrow'] = df['RainTomorrow'].fillna('No')

df["Date"] = pd.to_datetime(df["Date"])
# using data from last 3 years.
df_last_3_years = df.iloc[-950:,:]
plt.figure(figsize=[20,5])
plt.plot(df_last_3_years['Date'],df_last_3_years['MinTemp'],color='blue',linewidth=1,
label= 'MinTemp')
plt.plot(df_last_3_years['Date'],df_last_3_years['MaxTemp'],color='red',linewidth=1,
label= 'MaxTemp')
```

```
plt.fill_between(df_last_3_years['Date'],df_last_3_years['MinTemp'],df_last_3_years['MaxTemp'], facecolor = '#EBF78F')
plt.title('MinTemp vs MaxTemp by Date')
plt.legend(loc='lower left')
plt.show()
```



- Above plot shows that the MinTemp and MaxTemp relatively increases and decreases every year. As you can see that, December to February is summer; March to May is autumn; June to August is winter; and September to November is spring.
- The weather conditions are always opposite in the two hemispheres. As, the Australia is situated in the southern hemisphere. The seasons are bit different.

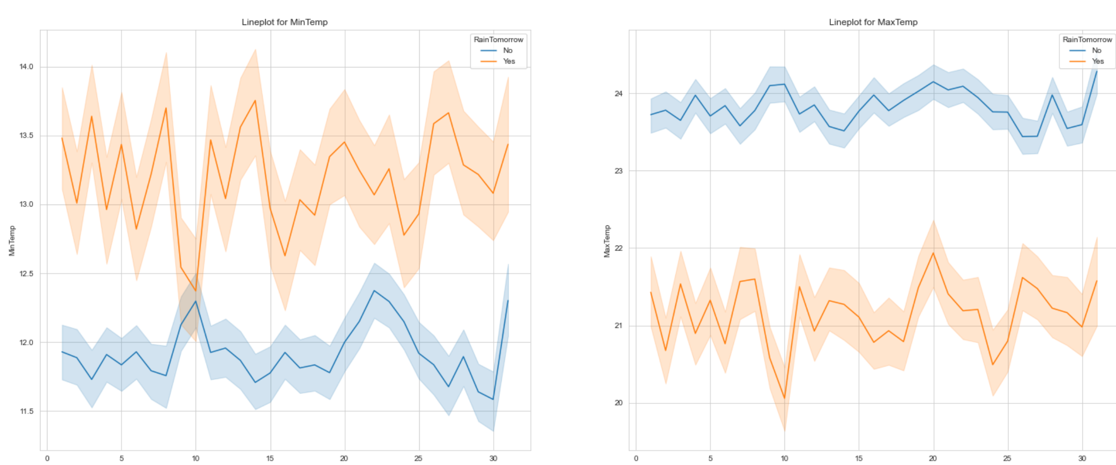
Handling DateTime Feature

```
df["year"] = df["Date"].dt.year
df["month"] = df["Date"].dt.month
df["day"] = df["Date"].dt.day

# We don't need date feature anymore for model building
df.drop('Date', axis=1, inplace=True)

fig, axes = plt.subplots(1, 2, figsize=(25, 10))

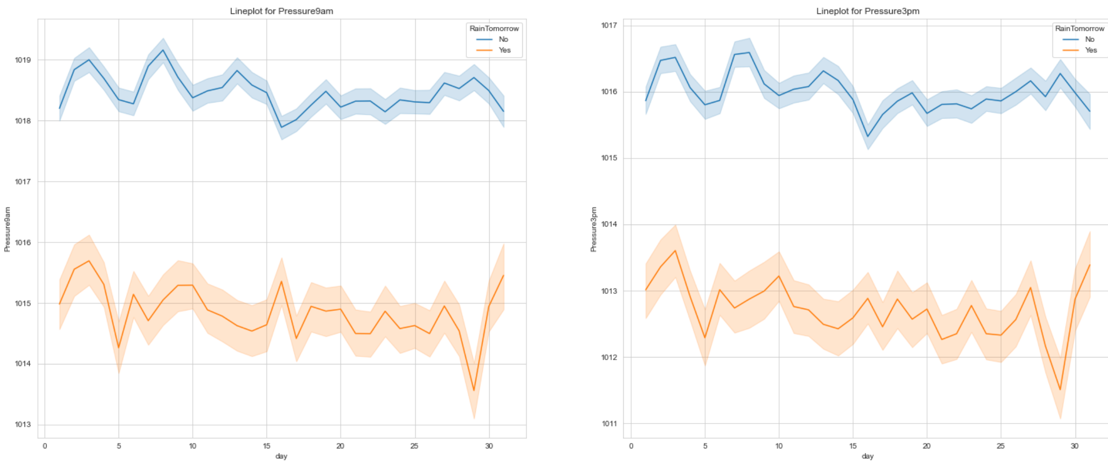
# Mintemp
sns.lineplot(ax=axes[0],x="day",y="MinTemp",hue="RainTomorrow",data=df)
axes[0].set_title('Lineplot for MinTemp')
# Maxtemp
sns.lineplot(ax=axes[1],x="day",y="MaxTemp",hue="RainTomorrow",data=df)
axes[1].set_title('Lineplot for MaxTemp')
plt.show()
```



If temperature difference between min and max temperature is low then probality of rain occuring tomorrow is more.

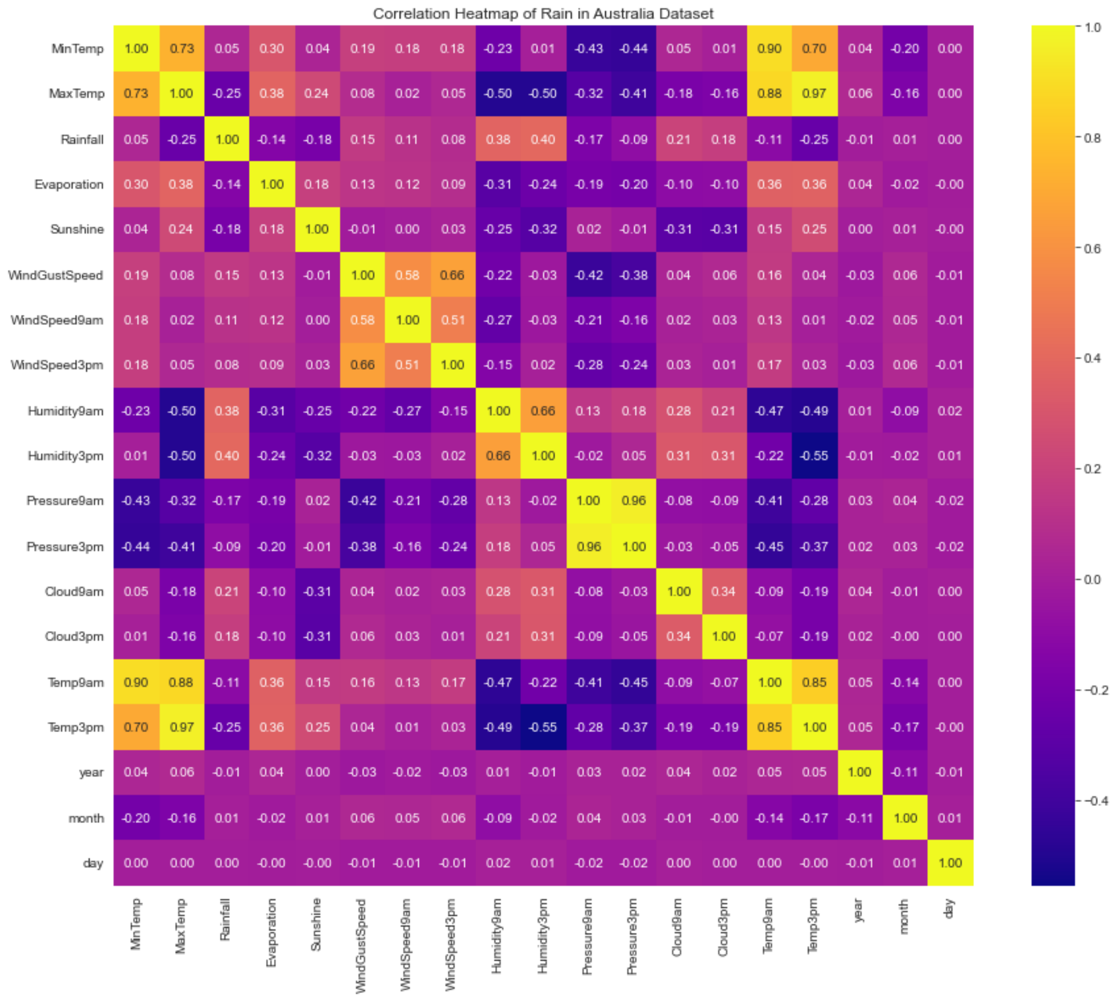
```python
fig, axes = plt.subplots(1, 2, figsize=(25, 10))

# Pressure9am
sns.lineplot(ax=axes[0],x="day",y="Pressure9am",hue="RainTomorrow",data=df)
axes[0].set_title('Lineplot for Pressure9am')
# Pressure3pm
sns.lineplot(ax=axes[1],x="day",y="Pressure3pm",hue="RainTomorrow",data=df)
axes[1].set_title('Lineplot for Pressure3pm')
plt.show()
```



```python
# lets check correlation again
corrmat = df.corr()

# heatmap
plt.figure(figsize=(16,12))
sns.heatmap(corrmat, square=True, annot=True, fmt='.2f', linecolor='white',
cmap='plasma')
plt.title('Correlation Heatmap of Rain in Australia Dataset')
plt.show()
```



Interpretation

From the above correlation heatmap, we can conclude that:-

- MinTemp and MaxTemp variables are highly positively correlated (correlation coefficient = 0.73).

- MinTemp and Temp3pm variables are also highly positively correlated (correlation coefficient = 0.70).

- MinTemp and Temp9am variables are strongly positively correlated (correlation coefficient = 0.90).

- MaxTemp and Temp9am variables are strongly positively correlated (correlation coefficient = 0.88).

- MaxTemp and Temp3pm variables are also strongly positively correlated (correlation coefficient = 0.97).

- WindGustSpeed and WindSpeed3pm variables are highly positively correlated (correlation coefficient = 0.66).

- Pressure9am and Pressure3pm variables are strongly positively correlated (correlation coefficient = 0.96).

- Temp9am and Temp3pm variables are strongly positively correlated (correlation coefficient = 0.85).

```
# features_to_be_dropped = ['Temp9am','Temp3pm','Pressure3pm']
# df.drop(features_to_be_dropped,inplace= True,axis=1)
```

LabelEncoding For Binary Features

```
# For binary features, we'll use labelencoding
le = LabelEncoder()

label_encoder_features = binary_categorical_features

for col in label_encoder_features:
    df[col] = le.fit_transform(df[col])

# let's check the head again
df.head()
```
